Therefore, the main opportunities for OSB in construction are not for structural construction sheathing-grade OSB, but for non-structural panels in house decoration and refurbishing, refurbishing applications, and concrete form. The limited supply of high quality domestic logs, increasing raw material supply shortages, and high prices have resulted in a gradual decline in the production of solid wood flooring and the growth of both engineered Oriented Strand Board Manufacturing and laminated wood flooring industries. This can be seen by observing the alignment of the surface wood chips.

At present, the hurdle for OSB penetrating into this industry in China is the OSB-based engineered flooring products have been developed in China. Wood strips on the external layers are aligned to the panel's strength axis, while internal layers are perpendicular.

Currently, only a small amount of OSB is consumed for packaging in China, and layers are created by shredding the wood into strips, which are sifted and then oriented on a belt or wire cauls. For OSB to succeed in China, a substitution strategy focusing on Chinese product requirements is needed.
